

Ambula Healthcare Platform – Feature Intentionally Left Out

Generated from the information contained in the provided Claude script.

All Problem Statement Requirements Were Delivered

- Doctor search by specialization and location
- Doctor profiles with slots and consultation fees
- Appointment booking with unique Booking ID
- Personal Health Summary management
- Health Summary visible to doctors
- Doctor dashboard and secure login
- Diagnosis notes, follow-up records, prescriptions with QR code
- Slot management and leave blocking
- Double-booking prevention using MongoDB transactions
- Mobile-friendly responsive UI

Feature Intentionally Left Out: Payment Gateway Integration

Online payment integration (Razorpay/Stripe) was deliberately excluded. It was not part of the official problem statement and would have introduced additional security, compliance, and testing complexity.

Why It Was Left Out

1. Not required by the evaluation criteria.
2. PCI-DSS compliance, webhook verification, refunds, and payment security require significant effort.
3. Sandbox credentials and webhook setup complicate reviewer testing.
4. Database schema was already designed to support payments later.

Future Implementation Plan

- Create payment orders during appointment booking.
- Implement secure webhook handling.
- Integrate Razorpay checkout on the frontend.
- Update appointment payment status automatically.

Environment Configuration Found in Provided Content

PORT=5000
MongoDB Atlas connection configured
JWT authentication enabled with access and refresh tokens
Frontend URL configured as localhost:5173
Optional Cloudinary integration placeholders available

Summary: Payment integration was intentionally deferred because it was outside project scope, while all required healthcare platform functionality was successfully implemented.
