
One Improvement With More Time

Doctor Schedule Management & Auto Slot Generation

Currently, slots are seeded once via `scripts/seed.js`. There is no UI for a doctor to manage their own availability — block days, change hours, add holidays, or set per-day overrides. This is the single biggest gap between the current prototype and a production-ready system.

What I Would Build

Calendar UI

A weekly/monthly drag-and-drop calendar where doctors mark unavailability, holidays, and custom-hour days directly from their dashboard.

Auto slot-generation (cron job)

A background job running nightly that auto-generates Slot documents 2–4 weeks ahead based on each doctor's workingHours config. This removes the need for manual seeding entirely.

Bulk slot operations

REST APIs to block or unblock date ranges in one call — e.g. a doctor going on annual leave for two weeks can block all their slots with a single request.

Recurring availability rules

Support recurring rules stored once (e.g. 'every Monday 9 AM–1 PM') and resolved lazily on query, rather than materialising thousands of Slot documents upfront.

Buffer time between appointments

Allow doctors to configure a buffer (e.g. 10 min) between back-to-back bookings to avoid overrun situations.

Why This Matters Most

Every other feature — booking, prescriptions, waitlist — already works. The only thing that blocks real clinic onboarding is that doctors cannot manage their own schedules without database access. This improvement would make Ambula self-serve and production-ready.
